Continuation of 11. does NOT place the application in condition for allowance because: for the reasons stated in the previous office action dated 24 January 2007.

Applicant argues that the instant specification teaches both the metal and the organic molecule contributing to the Raman signal enhancement that is greater than the enhancement provided by a silver colloid prepared by a tritation method and neither Kidwell nor McCormick discloses or suggests the metallic colloid with the specific organic molecules as described in applicant's specification and therefore the enhancement would not be an inherent property of the colloid. Applicant's argument is not persuasive because in example 1 of the instant specification, parts A and B disclose preparing colloidal particles by titration and heating after dissolving the precursor. Example 1 also discloses comparing the Raman enhancement of the claimed method with the colloids prepared by the titration method, but does not specify that the organic molecules have been attached at the time of comparison nor during the colloidal preparation method. Therefore, the comparison of only the metallic colloids and not organic molecules takes place and the property is inherent to any metallic colloids prepared by the recited method. Furthermore, McCormick teaches the organic molecule of the instant specification and the combination of Kidwell and McCormick teach the molecule attached to the metallic colloid particle. Therefore, the enhancement property is inherent to the colloid produced by the combination of references.
